

VISION PAY

Unified Loan & Repayment Management — Product Management Portfolio Case Study

Role: Product Manager / Product Owner | Project type: Fintech portfolio MVP

Product promise: Know what you owe. Know when it is due. Pay it. Track it.

Core journey: Verify → Discover → Understand → Pay → Track

1. The Problem

People managing multiple loans, credit cards, and other financial obligations may need to search across lender apps, statements, messages, documents, and support channels to understand what they owe, when it is due, and what to do when a repayment problem occurs.

The concept originated from an observed customer problem in an NBFC work environment: customers could struggle to find loan details, understand repayment status, and know how to pay after an EMI issue. This observation is the discovery input for the case study—not statistically representative research.

2. Opportunity

How might we help users securely discover, understand, track, and repay multiple financial obligations from one centralized platform without repeatedly searching for or manually entering repayment information?

3. Product Vision

Create a trusted repayment-management layer that gives users one place to understand and act on their financial obligations, while keeping security, privacy, consent, and reliability ahead of convenience.

4. Target Users

Persona	Need	Pain point
Rajesh Kumar — multi-obligation borrower	See all obligations and repay on time	Fragmented information and unclear repayment status
Digitally less-confident borrower	Complete routine repayment with confidence	Needs guidance finding account details and next actions

5. Jobs To Be Done

- When I have multiple financial obligations, I want one place to see what I owe and when it is due, so I can avoid missed repayments.
- When a repayment fails or becomes overdue, I want clear status and next steps, so I know how to resolve it.
- When I make a repayment, I want confirmation and history, so I can trust that the action was recorded.

6. Customer Journey

Stage	User need	VISION PAY response
Discover	Know what is owed	Unified obligations dashboard
Understand	Know amount, date, status	Clear obligation details
Act	Make repayment	Guided payment flow
Confirm	Know action succeeded	Confirmation/success state
Track	Review past actions	Repayment history

7. Competitive Positioning

Alternative	Strength	Gap / VISION PAY opportunity
Individual lender apps	Deep lender-specific data	Information remains fragmented across lenders
UPI/payment apps	Convenient payment execution	Not primarily organized around repayment obligations
Manual statements/SMS/email	Widely available	High search and interpretation burden
Financial tracking platforms	Broader financial visibility	VISION PAY focuses the experience on repayment action

8. Product Strategy

The strategy is to own the repayment problem rather than the broad category of 'all payments.' The product hierarchy is: 1) Security, 2) User satisfaction, 3) remaining convenience/features.

The core value loop is deliberately simple: Verify → Discover → Understand → Pay → Track.

9. MVP Definition

Priority	MVP capability	Purpose
P0	Secure onboarding/authentication	Establish trusted access
P0	Unified obligations dashboard	Make repayment responsibilities visible
P0	Due dates and status	Reduce uncertainty
P0	Payment initiation + review + confirmation	Enable the core action
P0	Repayment history	Provide traceability
P1	Support / repayment guidance	Help with failure and confusion
P1	Credit-health view	Supporting financial awareness
P2	Rewards	Engagement layer
P2	AI repayment assistant	Future discovery, not MVP dependency

10. Key Product Decisions

- Treat identity-based obligation discovery using Aadhaar/PAN as a hypothesis requiring validation, not a guaranteed capability.
- Keep CIBIL/credit health and rewards secondary to the repayment loop.
- Do not force AI into the MVP; future AI should be grounded in verified account information.

- Design security, privacy, consent, payment reliability, and financial-risk controls as first-class requirements.

11. Prototype

The working prototype demonstrates welcome/onboarding, KYC, PIN setup/login, dashboard, loans/bills, payment flow, payment confirmation/success, rewards, credit report, settings, help/support, and bottom navigation.

The prototype uses simulated financial data and does not connect to real Aadhaar, PAN, CIBIL, banks, lenders, UPI, cards, or payment networks.

12. Product Requirements

- Users can securely access the product through onboarding/authentication.
- Users can view financial obligations in a unified dashboard.
- Users can distinguish upcoming, active, and completed obligations.
- Users can initiate a repayment, review details, and receive a clear success/failure state.
- Users can view repayment history.
- Critical financial information must be presented clearly and consistently.
- Sensitive data handling must require appropriate security, privacy, consent, and audit controls in a real implementation.

13. Metrics & Analytics

North Star Metric: Successful repayment actions completed through VISION PAY.

Metric	Why it matters
Activation rate	Shows whether new users reach useful product value
Payment initiation rate	Measures movement from understanding to action
Payment completion rate	Measures core task success
Time to complete repayment task	Measures friction
Retention / repeat repayment usage	Measures continuing value
Satisfaction	Measures user experience
Payment errors / security incidents	Guardrails against harmful outcomes

14. Experimentation

Hypothesis: If the dashboard makes due amount, due date, and status immediately visible, users will complete repayment tasks faster and with fewer support interactions.

Primary outcome: task completion rate/time. Secondary outcomes: payment initiation/completion, support/contact rate, and satisfaction. Guardrails: payment errors, confusion, and security/privacy issues.

No statistical A/B result is claimed because the current prototype does not establish real-user sample data.

15. Roadmap

Phase	Focus
-------	-------

0 — Discovery	User interviews, journey mapping, data-access hypothesis validation, security/privacy review
1 — MVP	Onboarding, obligations dashboard, details, payment, confirmation, history
2 — Pilot	Usability testing, monitoring, support workflow, payment-failure recovery
3 — Scale	More institution connectivity, notifications, accessibility/localization
4 — Optimization	AI support, personalized insights, proactive assistance after validation

16. Responsible AI & Risk

Future AI opportunities include repayment assistance, explanation, and proactive support. AI should remain grounded in authoritative account information, avoid inventing financial facts, respect consent/privacy, and provide human escalation for sensitive or uncertain cases.

17. What Was Validated vs. What Was Not

Validated in this portfolio project	Still requires real validation
Working prototype and intended core journey	User willingness/trust
Clear MVP direction	Real obligation-discovery feasibility
Product requirements and metrics framework	Payment/institution connectivity
Coherent product narrative	Security, regulatory and compliance feasibility

18. Outcome & Learnings

- Start with the repayment problem, not the broad idea of 'all payments.'
- Repayment confusion can be an information and understanding problem, not only a payment-execution problem.
- A centralized product depends on trust and ecosystem connectivity; convenience alone is insufficient.
- AI is most credible when used selectively for explanation and support while verified financial facts remain authoritative.
- Strong PM work connects observation → problem hypothesis → prioritization → requirements → prototype → validation → metrics.

19. Final Product Decision

Proceed with VISION PAY as a portfolio MVP concept and use the working prototype as the demonstration artifact. Before any real-world launch, the highest-priority uncertainties are user validation, data-access feasibility, security/privacy, partner connectivity, payment reliability, and applicable regulatory/compliance requirements.

20. Resume-Ready Summary

VISION PAY | Product Management Case Study

- Defined a centralized repayment product concept to help users discover, understand, pay, and track multiple financial obligations from one experience.
- Translated an observed NBFC customer pain point into problem framing, personas, JTBD, customer journey, MVP scope, prioritization, user stories, acceptance criteria, and PRD requirements.
- Designed and refined a working portfolio prototype covering onboarding, authentication, unified obligations, payment confirmation, repayment history, credit health, rewards, settings, and support.
- Established a product analytics framework with successful repayment actions as the North Star Metric and defined activation, payment, retention, satisfaction, and security guardrails.
- Defined future AI opportunities for repayment assistance and explanation while treating privacy, consent, hallucination risk, and human escalation as product requirements.

21. Portfolio / LinkedIn Featured Summary

VISION PAY is a portfolio MVP designed to simplify how users discover, understand, repay, and track multiple financial obligations from one place. The product addresses fragmented repayment information through a centralized experience built around Verify → Discover → Understand → Pay → Track. The case study demonstrates problem discovery, user research planning, product strategy, MVP prioritization, PRD, UX flows, responsible AI thinking, metrics, experimentation, roadmap, backlog, Agile planning, and stakeholder management.

Portfolio Disclosure

This is a fictional/portfolio product case study based on an observed customer problem. The prototype uses simulated financial data and does not connect to real financial, identity, credit, banking, or payment systems. Research and business outcomes are not represented as validated unless explicitly stated.
