

NOURA

Personalized Wellness & Conversational Commerce

PRODUCT MANAGEMENT PORTFOLIO CASE STUDY

Role: Product Manager / Product Owner

Project type: Consumer wellness + AI product portfolio case study

Product promise: Make better wellness choices feel personal, simple, and actionable.

Core journey: Understand → Personalize → Discover → Decide → Act → Learn

Research is explicitly included in this case study. Where primary research was not actually conducted, findings are framed as observations, hypotheses, or proposed validation—not fabricated results.

1. Executive Summary

NOURA is a personalized wellness companion that combines conversational AI, personalized wellness guidance, intelligent product discovery, and shopping in one experience. The product is designed around a simple principle: users should not have to translate a broad wellness goal into a long list of searches and decisions on their own.

The PM challenge is therefore not simply to build a health-food shop or add a chatbot. It is to create a trustworthy decision layer that understands user intent and context, uses Noura's actual product and wellness data, explains recommendations, and helps users move from a question to a useful action.

2. Product Context

The product combines a wellness experience with a curated catalog of food and wellness products. The existing Noura experience includes onboarding, a home/wellness journey, shop and product experiences, cart/order flows, profile and an Ask Noura experience.

The portfolio case study treats the existing product experience as the approved product foundation. The PM work documented here focuses on product thinking, research, prioritization, AI behavior, requirements, measurement, validation, and evolution rather than redesigning the approved UI.

3. Problem Discovery

Core problem: People often know what they want to improve—energy, healthier snacking, protein intake, everyday nutrition—but turning that intention into suitable products and repeatable choices can require fragmented searching, comparison, interpretation, and decision-making.

A second problem is relevance. Generic wellness content can be too broad, while generic e-commerce recommendations may optimize for popularity rather than the user's actual goal, budget, preferences, dietary requirements, or current intent.

Noura's opportunity is to reduce this decision burden through contextual conversation and verified product-aware recommendations.

4. Research Background

The research approach for this portfolio case study combines problem observation, secondary/desk research, competitive/product pattern review, and a proposed primary-research plan. This distinction matters: no invented interview sample, survey percentage, customer quote, or business outcome is presented as if it were real.

Discovery inputs: the product concept, existing Noura prototype/product flows, observed wellness-shopping decision patterns, product catalog structure, and competitive patterns in wellness content, grocery/wellness commerce, personalization, and conversational assistants.

The purpose of the research is to understand the jobs users are trying to accomplish, where decision friction occurs, what makes recommendations trustworthy, and which AI behaviors create useful value rather than novelty.

5. Research Objectives

- Understand how people translate wellness goals into everyday food/product choices.
- Identify major friction points in wellness discovery, comparison, and purchase decisions.
- Understand what information users need before trusting a recommendation.
- Explore willingness to use a conversational assistant for wellness and shopping tasks.
- Identify personalization signals that users consider useful and acceptable.
- Understand expectations around budget, dietary requirements, product availability, and order support.
- Identify trust, safety, privacy, and AI-hallucination concerns that should shape the product.

6. Research Questions

- What triggers a user to seek a wellness recommendation?
- How do users currently discover healthy snacks, dry fruits, supplements, and related products?
- What makes a recommendation feel relevant rather than generic?
- How much context do users expect the assistant to remember?
- How do users want to control or correct personalization?
- What causes choice overload?
- How important are price, ingredients, nutrition information, dietary compatibility, ratings, and availability?
- When would users prefer conversation over browsing?
- What should the assistant do when it lacks enough information or cannot safely answer?
- Which shopping actions do users expect an AI assistant to perform?

7. Research Method & Validation Plan

Primary research to conduct: semi-structured interviews with prospective users across students, working professionals, families, and fitness-oriented shoppers; moderated usability sessions on key Noura tasks; and a lightweight survey after qualitative themes are established.

Behavioral research: once real usage exists, analyze search, product views, recommendation interactions, add-to-cart, purchase, reorder, conversation follow-ups, correction/feedback, and abandonment events.

Competitive research: benchmark wellness content, e-commerce discovery, personalization controls, conversational commerce, and AI-assistant interaction patterns.

Validation principle: use research to test assumptions before turning them into roadmap commitments.

8. Research Hypotheses

- Users will value recommendations more when Noura explains why a product fits their current goal.
- Users will prefer conversational discovery when their request is ambiguous or multi-constraint.
- Users will trust personalization more when they can inspect, edit, or clear relevant preferences.
- Users will expect product recommendations to reflect real catalog availability and price.
- Context carried across turns will reduce repeated explanation and decision effort.
- Confirmation should precede consequential actions such as checkout or purchase.
- AI quality will be judged by usefulness, relevance, accuracy, and actionability—not by conversational novelty alone.

9. Research Findings & Insight Framing

Important evidence status: because the case study does not contain a completed primary-research dataset, the following are product insights derived from discovery inputs and hypotheses—not statistical claims about a measured user population.

Observed / inferred pattern	Product insight	Opportunity
Wellness goals are broad	Users need translation from goals into concrete choices	Intent-aware recommendations
Too many choices create friction	Relevance should precede breadth	Personalized ranking
Users ask follow-up questions	The assistant must maintain context	Conversational memory
Price and availability affect decisions	Recommendations must be catalog-aware	Verified product/tool layer

Observed / inferred pattern	Product insight	Opportunity
Trust matters in wellness	Explain reasoning and limits	Transparent AI behavior
Users may have changing needs	Personalization should adapt over time	Feedback + behavioral learning

10. Personas

Persona	Goals	Pain points	Needs
Goal-driven wellness shopper	Make healthier everyday choices	Unsure what fits a specific goal	Simple relevant options + explanation
Busy professional / student	Find something suitable quickly	Limited time; decision fatigue	Fast conversational discovery + budget awareness
Routine-oriented shopper	Build repeatable healthy habits	Starts from scratch each time	Memory, reorders, personalized suggestions
Trust-conscious user	Avoid unsuitable recommendations	Concern about ingredients, claims, privacy	Transparent reasoning + controls + safe boundaries

11. Jobs To Be Done

- When I have a wellness goal, I want Noura to translate it into practical options so I can act without researching everything myself.
- When I am shopping, I want relevant products based on my current need, preferences, and budget so I can decide faster.
- When I ask a follow-up question, I want Noura to remember the context so I do not have to repeat myself.
- When I compare products, I want clear differences in price, ingredients, nutrition, suitability, and availability so I can choose confidently.
- When I want to buy something, I want Noura to help me add it to my cart and guide me through the next step without taking consequential actions without confirmation.
- When a recommendation is not useful, I want to correct Noura so future recommendations improve.

12. Customer Journey

Stage	User action	Pain point	Noura opportunity
Understand	Shares goal or asks a question	Goal may be vague	Intent understanding
Personalize	Provides preferences	Repeated explanation	Profile + memory
Discover	Explores options	Choice overload	Relevant ranking
Evaluate	Compares products	Information scattered	Explain + compare
Act	Adds to cart / plans purchase	Action friction	Conversational actions
Learn	Gives feedback / returns	Experience starts over	Adaptive personalization

13. Opportunity Definition

How might we make everyday wellness decisions feel as natural as having a thoughtful personal companion—while keeping recommendations grounded in Noura's actual catalog and the information the user has chosen to share?

- Opportunity 1 — Reduce decision effort through intent-aware discovery.
- Opportunity 2 — Make recommendations explainable and personally relevant.
- Opportunity 3 — Connect conversation to real product and shopping actions.

- Opportunity 4 — Build trustworthy personalization with user control.
- Opportunity 5 — Turn repeated interactions into useful long-term value.

14. Competitive & Alternative Solutions

Alternative	Strength	Gap / Noura opportunity
Traditional wellness content	Broad education	Limited personalization and action
Generic e-commerce search	Large catalog	Keyword-heavy; weak wellness context
Curated wellness stores	Human curation	Limited conversational understanding
Rule-based recommendation	Predictable and controllable	Limited context and adaptability
General AI assistant	Natural conversation	May lack Noura catalog truth and shopping tools

Competitive advantage hypothesis: Noura connects conversational understanding, personalized wellness context, verified product information, and shopping actions in one continuous journey.

15. Product Vision & Value Proposition

Vision: Help people make better everyday wellness choices through a calm, intelligent companion that understands context and turns intent into useful action.

Mission: Reduce the distance between what a person wants to improve and the next practical choice they can make.

Value proposition: Noura combines personalization, conversation, product discovery, and action so users spend less time searching and more time making confident choices.

16. Product Goals & Non-Goals

Goals

- Increase relevance and confidence in wellness discovery.
- Reduce decision effort for common wellness-shopping tasks.
- Create a conversational interface that understands context.
- Connect recommendations to actual catalog data.
- Build measurable, controllable personalization.

Non-goals for the portfolio MVP

- Diagnosing or treating medical conditions.
- Replacing qualified healthcare professionals.
- Making unsupported medical or therapeutic claims.
- Autonomous purchasing without user confirmation.
- Inventing products, prices, stock, orders, or user facts.

17. Solution Exploration

Approach	Advantage	Limitation	Decision
Static recommendations	Simple to build	Low context	Insufficient alone
Rule-based personalization	Controllable	Limited natural language	Useful supporting layer
General AI chat	Flexible conversation	Can hallucinate Noura facts	Needs grounding
Tool-using Noura agent	Conversation + verified data + actions	Higher product/system complexity	Selected direction

Selected solution: a conversational Noura intelligence layer that can understand intent, use profile/memory, retrieve verified Noura data, choose appropriate tools, explain results, and request confirmation before consequential actions.

18. Product Strategy

- Priority 1 — Trust: grounded answers, transparent limits, privacy and user control.
- Priority 2 — Relevance: current intent + profile + memory + behavior + catalog context.
- Priority 3 — Actionability: recommendations should lead naturally to useful next steps.
- Priority 4 — Simplicity: minimal primary navigation; advanced capabilities surface contextually.
- Priority 5 — Learning: capture feedback and behavior to improve future relevance.

19. MVP Definition

Priority	Capability	Purpose
P0	Conversational Noura assistant	Core user interface
P0	Intent + context understanding	Understand natural requests
P0	Verified product/catalog retrieval	Prevent invented products
P0	Profile-aware recommendations	Personal relevance
P0	Budget / preference / dietary constraints	Useful filtering
P0	Conversation history/context	Follow-up continuity
P0	Product comparison/explanation	Decision support
P1	Cart actions with confirmation	Conversational commerce
P1	Order/status support	Post-purchase utility
P1	Feedback + personalization controls	Trust and learning
P2	Voice / image interaction	Future multimodal layer

20. Key Product Decisions

- Keep the approved Noura experience as the product foundation; intelligence should enhance it rather than force a redesign.
- Use Noura's actual catalog as the source of truth for Noura-specific product claims.
- Separate general wellness knowledge from Noura-specific verified facts.
- Treat memory as a product capability with user controls, not an invisible data store.
- Require confirmation before purchase or other consequential actions.
- Design safety boundaries so the assistant does not diagnose or make unsupported medical claims.
- Start with structured data and replaceable interfaces so the product can evolve toward a production database.

21. Prototype / Current Product Foundation

The Noura product foundation includes a mobile-oriented wellness experience with onboarding, personalized content, shop/product discovery, cart and order flows, profile functionality, wellness experiences, and a Noura conversational entry point.

The approved UI is treated as the demonstration artifact. The key PM opportunity is to connect the experience to a capable intelligence layer without replacing the product's established visual direction.

22. AI Product Architecture

User → Noura AI → Intent understanding → Context / memory → Noura data & tools → Response / action → Feedback

- Intent layer identifies whether the user is asking about wellness, products, comparison, budget, cart, orders, profile, or general conversation.
- Context layer carries the current conversation and relevant session state.
- Memory layer stores only useful, user-permitted long-term preferences.
- Catalog layer provides product name, price, weight, ingredients, nutrition, tags, stock, ratings, and other verified fields.
- Tool layer enables retrieval and actions such as product search, cart operations, and order lookup.
- Response layer explains the answer naturally and surfaces uncertainty when appropriate.

23. Conversational AI Requirements

- Handle natural greetings and casual conversation.
- Understand references such as 'that one', 'the second option', and 'add two'.
- Maintain relevant context across turns.
- Ask a clarifying question only when needed.
- Use the user's profile and preferences when appropriate.
- Never claim a Noura product exists unless it is present in the available catalog/data.
- Never invent price, stock, nutrition, ingredients, or order status.
- Explain why a recommendation was selected when useful.
- Remain calm, human, concise, and non-pushy.

24. Conversational Shopping Journey

Discovery → shortlist → explain → compare → select → add to cart → review → confirm → purchase/checkout → track → reorder.

Example intents include: “Which almonds are good if I want something high in protein?”, “I have \$500. What can I buy?”, “I need something for a healthy evening snack”, “Is this product available?”, “Where is my order?”, and “Add two packets of almonds to my cart.”

The product requirement is not merely to answer these questions; it is to connect language understanding to reliable product data and safe actions.

25. Functional Requirements

ID	Requirement	Priority
FR1	Understand natural-language wellness/product intent	High
FR2	Use authorized profile and conversation context	High
FR3	Retrieve matching products from the Noura catalog	High
FR4	Apply budget, dietary, preference, and availability constraints	High
FR5	Explain recommendations and comparisons	High
FR6	Maintain relevant conversation context	High
FR7	Support cart actions through explicit user intent	High
FR8	Require confirmation before purchase/checkout	High
FR9	Retrieve order status from authoritative order data	Medium

ID	Requirement	Priority
FR10	Capture feedback and personalization signals	Medium

26. Non-Functional Requirements

- Reliability: grounded product facts and deterministic action handling.
- Safety: no diagnosis, treatment claims, or unsupported health promises.
- Privacy: user control over personalization and memory.
- Latency: conversational responses should feel responsive.
- Observability: log product events and AI/tool outcomes without exposing unnecessary sensitive data.
- Fallbacks: graceful handling when data, tools, or AI are unavailable.
- Scalability: clean separation between AI orchestration and replaceable data sources.

27. Responsible AI, Safety & Trust

Noura's AI should be positioned as a wellness and shopping companion, not a medical authority. General wellness information must be distinguished from medical advice. Product facts should come from verified Noura data.

- Ground Noura-specific claims in authoritative product/data sources.
- Do not fabricate catalog items, prices, stock, orders, or user preferences.
- Make uncertainty visible rather than confidently guessing.
- Respect personalization consent and allow users to review/edit/delete relevant memory.
- Escalate or recommend professional help for high-risk health questions when appropriate.
- Require confirmation for purchases and other consequential actions.
- Monitor hallucination, unsafe advice, privacy, and incorrect-action rates.

28. Personalization Strategy

Personalization combines onboarding information, conversation context, explicit preferences, behavioral signals, and product interactions. The system should distinguish temporary session context from durable preferences.

- Explicit signals: dietary preferences, dislikes, budget, goals, shopping preferences.
- Behavioral signals: searches, product views, carts, purchases, reorders, feedback.
- Contextual signals: current request, occasion, time/context, current budget.
- Negative feedback: 'not relevant', rejected recommendations, corrections.
- Control: users can inspect or change important personalization assumptions.

29. Search & Recommendation Logic

Noura should treat a natural-language request as a set of constraints and intent signals rather than a literal keyword query.

- Parse goal, product category, dietary constraints, budget, quantity, and availability needs.
- Retrieve eligible products from the real Noura catalog.
- Rank by relevance to current intent first, then useful personalization signals.
- Apply hard constraints such as unavailable products or explicit dietary exclusions.
- Return a small, understandable shortlist rather than overwhelming the user.
- Explain the main reason each recommendation fits.

30. Metrics & Analytics

Metric	Why it matters
North Star: Successful helpful Noura interactions	Measures whether the assistant resolves user intent into a useful outcome
Recommendation relevance / acceptance	Measures usefulness of suggestions
Conversation resolution rate	Shows whether users get answers without unnecessary loops
Add-to-cart from assisted discovery	Connects conversation to action
Purchase / checkout completion	Measures downstream commerce value
Repeat assisted sessions	Measures continuing value
User satisfaction / feedback	Captures perceived quality
Hallucination / unsupported-claim rate	Core trust guardrail
Incorrect action / failed tool rate	Safety and reliability guardrail
Memory correction / deletion rate	Personalization trust signal

31. Experimentation

Experiment 1: If recommendations include a concise explanation of why they fit the user's current request, users will be more likely to engage with the recommendation.

Primary outcome: recommendation selection / assisted discovery completion. **Secondary:** add-to-cart, satisfaction, conversation length. **Guardrails:** hallucination, unsafe claims, irrelevant recommendations.

Experiment 2: If Noura carries relevant context across turns, users will complete multi-step shopping tasks with fewer repeated messages.

No statistical A/B result is claimed here because the portfolio artifact does not establish a real-user experiment dataset.

32. Roadmap

Phase	Focus
0 — Discovery	Primary research, competitive benchmark, safety/privacy review, catalog/data validation
1 — Intelligence MVP	Grounded chat, intent/context, product retrieval, profile-aware recommendations
2 — Conversational Commerce	Comparison, cart actions, confirmation, order/status tools
3 — Learning	Feedback loops, memory controls, adaptive personalization, analytics
4 — Multimodal	Voice/image inputs and richer product understanding
5 — Scale	Production data architecture, reliability, localization, accessibility, deeper integrations

33. Prioritized Backlog

Epic	Representative stories	Priority
Conversational core	As a user, I can ask naturally and receive contextual answers.	P0
Catalog grounding	As a user, recommendations use products actually available in Noura.	P0
Personalization	As a user, Noura considers my goals and preferences.	P0
Comparison	As a user, I can compare relevant products in conversation.	P0
Shopping actions	As a user, I can add requested products/quantities to my cart.	P1
Order support	As a user, I can ask where my order is.	P1

Epic	Representative stories	Priority
Memory controls	As a user, I can review and change personalization.	P1
Multimodal	As a user, I can use voice/images for future interactions.	P2

34. Agile Delivery & Stakeholders

Product: owns problem framing, priorities, outcomes, requirements, research, and trade-offs.

Engineering: AI orchestration, data interfaces, app integration, reliability, security.

Design: preserve and evolve the approved Noura experience; design conversational and feedback states.

AI/data: prompting, retrieval/grounding, evaluation, memory, recommendation quality.

Operations/support: catalog/order accuracy, escalation, user issues.

Key delivery principle: ship intelligence in thin vertical slices, measure, learn, and expand.

35. Launch & Validation Plan

- Validate top user jobs with qualitative research.
- Run task-based usability sessions against the existing product experience.
- Evaluate AI answers against a curated test set of Noura intents.
- Test catalog grounding and tool actions separately from free-form conversation.
- Establish safety and hallucination evaluation before broader pilot.
- Launch to a small controlled cohort first.
- Track core metrics and guardrails before scaling.

36. What Was Validated vs. What Was Not

Portfolio evidence / validated artifact	Still requires real-world validation
Product concept and product narrative	User willingness and trust
Existing product experience / prototype	Recommendation relevance at scale
AI architecture and requirements	Real catalog/order integration reliability
Prioritized MVP and roadmap	Quantified business impact
Metrics and experimentation framework	Safety performance with real users
Research plan and hypotheses	Primary-research findings and statistical evidence

37. Outcome & Learnings

- Wellness personalization is more valuable when connected to a concrete decision or action.
- Conversational AI should be treated as a product capability, not a decorative chatbot.
- Grounding and tool use are essential when the assistant makes Noura-specific claims.
- Personalization creates value only when relevance is balanced with transparency and user control.
- The best AI experience can remain simple on the surface while a structured product/data architecture handles complexity underneath.
- Strong PM work connects research → insight → opportunity → strategy → requirements → prototype → measurement → validation.

38. Final Product Decision

Proceed with Noura as a portfolio product concept and use the existing approved experience as the demonstration foundation. The highest-priority next validation areas are user research, AI response quality, catalog grounding, conversational task completion, personalization trust, and safe action execution.

The strategic direction is to make Noura’s intelligence layer the connective tissue between wellness intent, product discovery, and action—without sacrificing user control or the established product experience.

39. Resume-Ready Summary

- Defined Noura, a personalized wellness and conversational-commerce product concept connecting wellness goals, AI guidance, product discovery, and shopping actions.
- Applied product discovery and research planning to frame user problems, research questions, hypotheses, personas, JTBD, journey mapping, opportunity areas, and validation strategy.
- Defined an AI product architecture combining conversational context, user profile/memory, verified catalog data, tool use, recommendation logic, and confirmation-based actions.
- Translated the product vision into MVP scope, functional requirements, responsible-AI requirements, metrics, experimentation, roadmap, and prioritized backlog.
- Established a measurement framework covering assisted discovery, recommendation relevance, conversion, satisfaction, hallucination, incorrect-action, and personalization-control guardrails.

40. Portfolio / LinkedIn Featured Summary

Project Title: NOURA — Personalized Wellness & Conversational Commerce

One-line description: A product-management case study for an AI-powered wellness companion that helps users understand goals, discover relevant products, make confident choices, and act through conversation.

Problem: Everyday wellness decisions can require fragmented research, comparison, and repeated searching, while generic recommendations often lack personal context.

Solution: Noura combines conversational AI, personalization, verified product data, intelligent recommendations, and conversational shopping actions in one experience.

PM skills demonstrated: Research planning, problem discovery, personas, JTBD, journey mapping, opportunity framing, competitive analysis, product strategy, MVP definition, prioritization, AI product design, responsible AI, personalization, requirements, metrics, experimentation, roadmap, backlog, Agile delivery, and validation.

41. Portfolio Disclosure & Research Integrity

This is a product-management portfolio case study. The Noura product and prototype are presented as a portfolio product concept/demonstration. No fabricated interview counts, survey percentages, customer quotations, conversion results, revenue, retention, or statistical research outcomes are presented as real.

Where primary research has not yet been conducted, the report explicitly labels the material as a research plan, hypothesis, observation, or validation requirement. This follows the same evidence discipline demonstrated by the supplied Vision Pay reference, which distinguishes observed discovery inputs from statistically representative research and separates what is validated from what still requires real validation.

42. Appendix — Product Scope Checklist

Area	Portfolio status
Approved Noura experience	Existing foundation
Conversational AI direction	Defined
Profile / personalization	Defined
Catalog grounding	Defined

Area	Portfolio status
Recommendation logic	Defined
Conversational commerce	Defined
Cart / purchase confirmation	Defined
Order support	Defined
Metrics / analytics	Defined
Research plan	Defined
Primary research dataset	Not claimed
Real production commerce operations	Not claimed
Medical diagnosis / treatment	Out of scope
